Set Up Search Dictionaries

Commerce Cloud is now Agentforce Commerce and B2C Commerce is now Agentforce Commerce for B2C. You may see references to Commerce Cloud and B2C Commerce in our applications and documentation.

Learning Objectives

After completing this unit, you'll be able to:

- List three standard search features in Agentforce Commerce for B2C.
- List the five standard search dictionaries.
- Describe three ways Agentforce Commerce for B2C can sort search results.
- List the three general steps you must take to configure Search Dictionaries.

Introduction

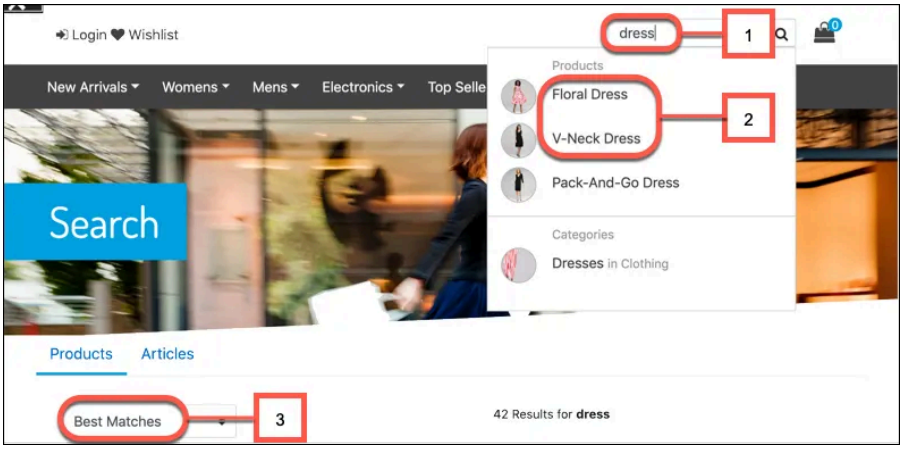
Brandon Wilson is a merchandiser at Cloud Kicks, a company that specializes in high-end custom sneakers. The Cloud Kicks Agentforce Commerce for B2C storefront is attracting lots of attention and sales are great. But Brandon wants to ramp up search capabilities to improve the shopper experience and drive sales even further. He can do that with Agentforce Commerce Einstein.

In this unit, Brandon reviews the great Agentforce Commerce for B2C search features that Cloud Kicks currently uses. Then he explores how Agentforce Commerce Einstein can push those features into overdrive.

Agentforce Commerce for B2C Storefront Search

Agentforce Commerce for B2C comes out-of-the-box with:

- **Keyword Search:** The shopper enters a search term and the results display on the storefront (1).
- **Search Suggestions:** As the shopper types, the storefront displays a list of possible results. At the same time, the software tries to complete the search term and automatically corrects spelling (2).
- **Search Results Sorting:** Shoppers select how they want their results to sort (3).



What Are Search Dictionaries?

Agentforce Commerce for B2C uses search dictionaries to provide search results. The better Brandon's search dictionaries are, the more likely his shoppers can find what they're looking for in their search results. Dictionaries include:

- **Synonyms:** Words that mean the same thing.
- **Hypernyms:** Term for a group of products. For example, the word top is a hypernym that contains the hyponyms tunic, shirt, and blouse. When a shopper searches for top, Agentforce Commerce for B2C returns products that contain top, tunic, shirt, and blouse.
- **Hyponyms:** Term for an item in the group of products that a hypernym describes. For example, blouse is a hyponym of the hypernym top. When the shopper searches for blouse, Agentforce Commerce for B2C only returns products that contain blouse.
- **Common phrases:** Word combinations that Agentforce Commerce for B2C must find together.
- **Compound words:** Words that Agentforce Commerce for B2C splits into separate terms, based on a configuration rule that you set. For example, if you configure foot-*, a search for footstool returns results for foot and stool.
- **Stop words:** Words that Agentforce Commerce for B2C ignores, such as an or the. Stop words keep the index more compact so results display faster.

After Agentforce Commerce for B2C checks its dictionaries, it sorts the results on the storefront. Agentforce Commerce for B2C sorts results based on the merchant or shopper-driven sorting rules that you configure in Business Manager.

How Einstein Adds Value

Brandon investigates how Agentforce Commerce Einstein ramps up the results of each these search features.

Feature	Standard Agentforce Commerce for B2C	Agentforce Commerce Einstein	Einstein Feature
Keyword Search	Dictionaries that you manually create based on your own specific data	Data that Einstein pulls from live searches and search results from many merchants and adds to existing dictionaries	Search Dictionaries
Search Suggestions	Basic search-as-you-type with advanced features: spelling correction and search term completion	Algorithms that add: • Recent user search phrases • Popular and trending search phrases • Personalized auto-correction and term-completion	Search Recommendations
Search Results	Configured search result settings for: • Keyword search • Category navigation • Storefront sorting options selected by shoppers • Behind-the-scenes via dynamic attributes or configured keyword groups	As Agentforce Commerce Einstein collects data, Predictive Sort learns about each shopper and increases the personalized sorting experience for them. This feature also enhances search results and suggestions.	Predictive Sort

Keyword Search

Shoppers want to find what they're looking for now or they look elsewhere. With standard Agentforce Commerce for B2C keyword search, Brandon creates his search dictionaries manually. For example, he adds the term "high-top sneaker" to his list of compound words. Creating dictionaries this way is a manual effort that requires a deep understanding of his products and the locales he sells to.

Einstein Search Dictionaries pulls data automatically from live searches and search results from many merchants. It automatically detects relationships between search terms, and adds this data to existing dictionaries. No manual effort is involved!

Search Recommendations

Search recommendations begin as soon as a shopper starts typing into the search field. Agentforce Commerce for B2C comes with a basic search-as-you-type feature. Brandon can add automatic spell-correction and search term completion using Business Manager settings.

Einstein Search Recommendations applies algorithms to Agentforce Commerce for B2C data to identify the most relevant search results per shopper, even before the shopper types all the text. Using various data points, Einstein identifies recent user search phrases, popular and trending search phrases, and personalized auto-correction and term-completion.

Brandon's shoppers can explore his site on the quickest path to conversion.

Search Results Sorting

Brandon uses Business Manager to configure how he wants Agentforce Commerce for B2C to sort search results. He can display a dropdown so shoppers can sort the results themselves, and he can perform behind-the-scenes sorting to promote certain types of products for:

- Keyword searches
- Category navigation
- Dynamic attributes, such as availability, or configured keyword groups

With Einstein Predictive Sort, Brandon can deliver more tailored and relevant search results by incorporating multiple data points from:

- Catalogs and products
- Order history

Based on a shopper's behavior and affinity to products, Einstein saves a cookie on the shopper's device that includes the shopper's assignment to specific products. This assignment can change within a session and works for registered and unknown shoppers. As Einstein collects data, Predictive Sort learns about each shopper and increases the personalization of search results sorting. Predictive Sort works with every type of behind-the-scenes sorting.

Now that Brandon understands how Einstein can make his storefront search even smarter, he's eager to deploy the features. He tackles Einstein Search Dictionaries first.

Search Dictionaries

To start with, the search dictionaries, enabled by default in Agentforce Commerce for B2C, uses only the site's data. Once Brandon accepts the Einstein Data Privacy Agreement, he has access to community data and his search dictionaries are combined with data from the other contributing Agentforce Commerce for B2C merchants.

When enabled, Einstein Search Dictionaries consumes all site searches and search-related settings and identifies terms that shoppers search for but that are not in a dictionary. Using artificial intelligence (AI), it automatically detects relationships between search terms, recommends which synonym list to assign them to, and then creates new recommendations.

With Einstein Search Dictionaries, Brandon can:

- View new Einstein Search Dictionaries recommendations.
- Accept or reject suggestions.
- Blocklist specific terms.
- Create new dictionary word stems with the Stemming Exceptions option.

Configure Search Dictionaries

To get the full benefit of Einstein Search Dictionaries, Cloud Kicks must share data with other merchants. That's where the Einstein Data Privacy Agreement comes in. Linda Rosenberg, the Cloud Kicks' administrator, must accept the terms and conditions of the Einstein Data Privacy Agreement on her staging instance, so Brandon can get started.

In this module, we assume you are a Agentforce Commerce for B2C merchandiser with the proper permissions to perform these tasks. If you're not a Agentforce Commerce for B2C merchandiser, that's OK. Read along to learn how your merchandiser would take these steps in a staging instance. Don't try to follow our steps in your Trailhead Playground. Agentforce Commerce for B2C isn't available in the Trailhead Playground. If you have a staging instance of Agentforce Commerce for B2C, you can try out these steps in your instance. If you don't have a staging instance, ask your manager if there is one that you can use.

With the privacy agreement, Linda gives her company's consent to contributing its search dictionary data to a shared database. This provides recommendations to other merchants who've also consented to contribute to the shared database. Salesforce represents and warrants that it does not disclose a merchant's search dictionary data to any other customer in identifiable form.

Linda further acknowledges that Salesforce can access her company's search dictionary data submitted to Agentforce Commerce for B2C for training and to improve the Einstein Search Dictionary and any other current or future similar or related features, products, or services.

Let's see how Linda gives consent in just a few clicks.

To access Business Manager, you must have a Agentforce Commerce for B2C implementation. In this module, we assume you are a Agentforce Commerce for B2C administrator or merchandiser with the proper permissions to perform these tasks. If you're not a Agentforce Commerce for B2C administrator or merchandiser, that's OK. Read along to learn how your administrator would take these steps in a staging instance. Don't try to follow our steps in your Trailhead Playground. Agentforce Commerce for B2C isn't available in the Trailhead Playground. If you have a staging instance of Agentforce Commerce for B2C, you can try out these steps in your instance. If you don't have a staging instance, ask your manager if there is one that you can use.

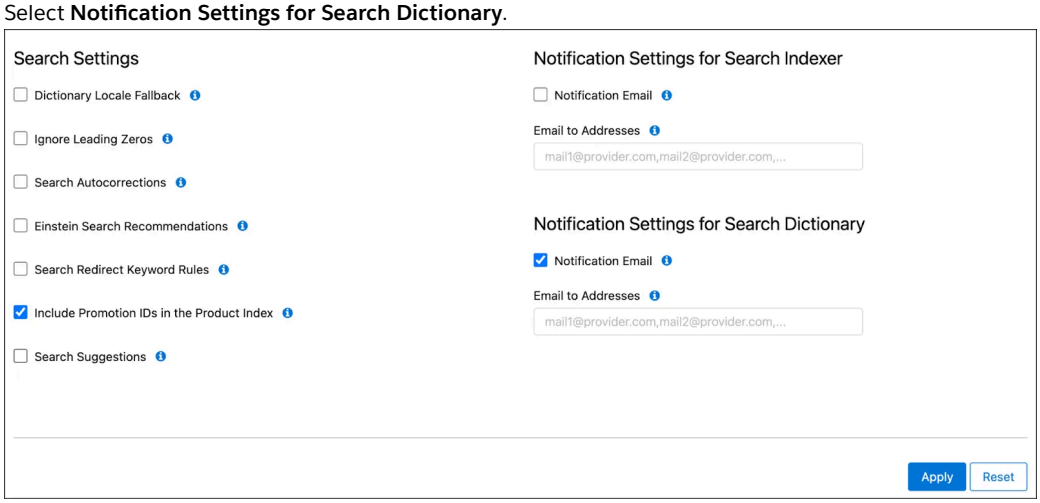
Here's how to contribute search dictionary data to the shared database.

1. In Business Manager, click **App Launcher** and select **Administration | Global Preferences | Einstein Search Dictionaries Opt-In**.
2. Select **I accept these terms and conditions**.
3. Click **Save**.

Here's how Brandon configures Search Dictionaries.

Add the email addresses of people who plan to manage synonyms.

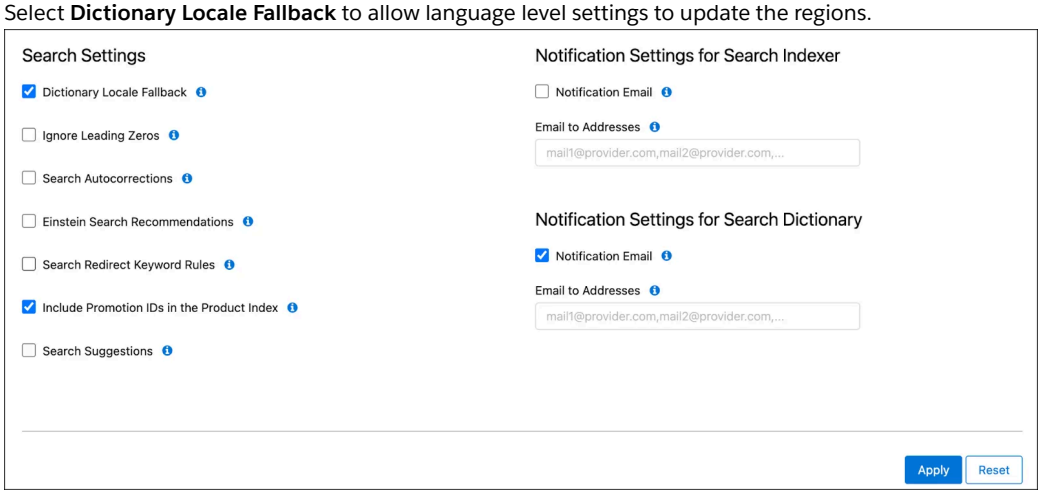
1. In Business Manager, click **App Launcher** and select **Merchant Tools | Site | Site Preferences | Search Preferences**.
2. Select **Notification Settings for Search Dictionary**.



3. Add the emails.
4. Click **Apply**.

If the site has multiple locales:

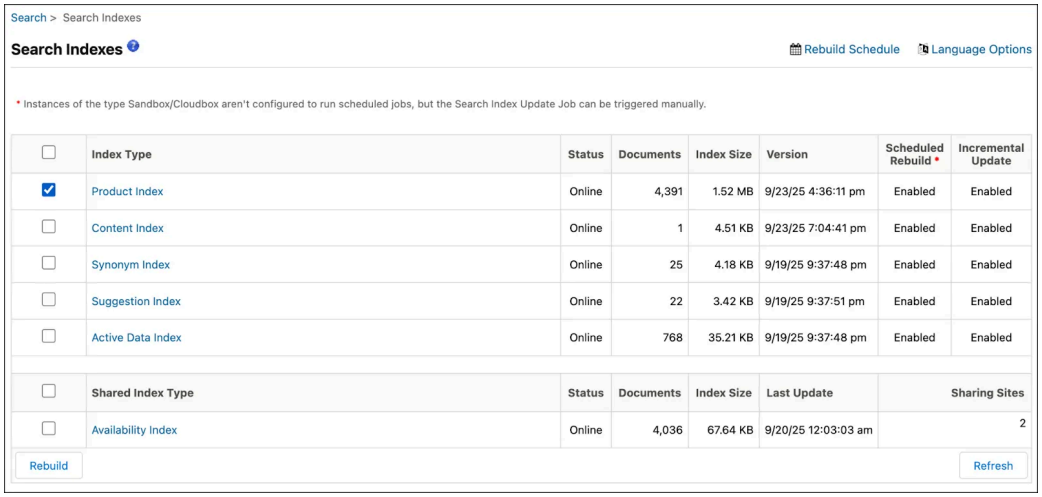
1. In Business Manager, click **App Launcher** and select **Merchant Tools | Site | Site Preferences | Search Preferences**.
2. Select **Search Settings**.
3. Select **Dictionary Locale Fallback** to allow language level settings to update the regions.



Rebuild the search index.

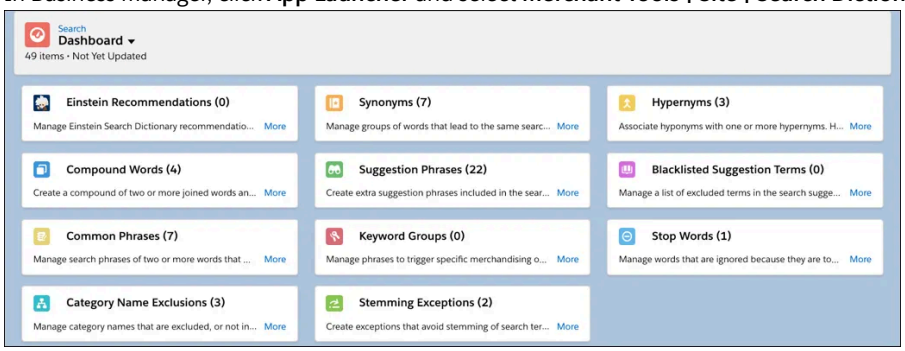
1. In Business Manager, click **App Launcher** and select **Merchant Tools | Site | Search | Search Indexes**.
2. Select the checkbox for the relevant indexes.

3. Click **Rebuild**.



Here's how he uses Search Dictionaries.

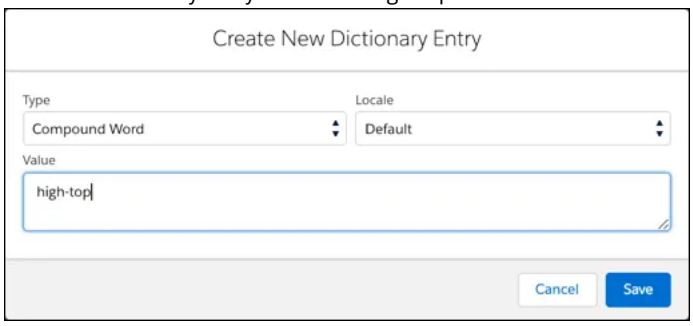
1. In Business Manager, click **App Launcher** and select **Merchant Tools | Site | Search Dictionaries**.



2. Click or select a dictionary type, for example, **Compound Words**.
3. Click **New** to create a new dictionary entry.

   Required fields are indicated by a red dot. The type is already selected: Compound Word.

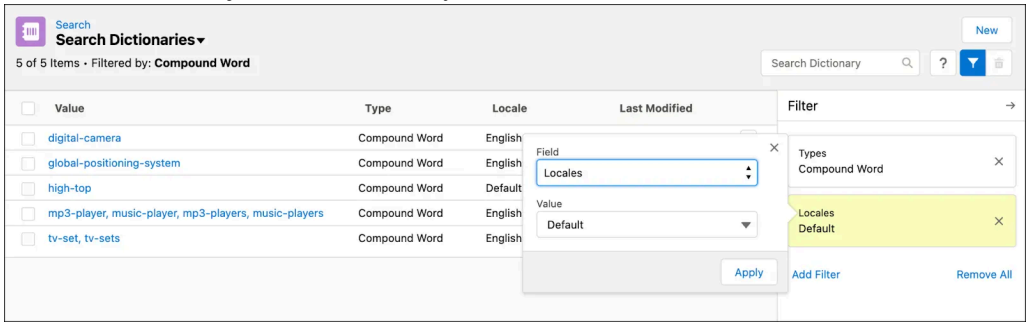
4. Select the locale.
5. Enter the dictionary entry as a value: high-top.



6. Click **Save**.

To edit an entry you can search or filter to find it.

1. Click **Search Dictionary** to search for an entry across dictionaries.



2. You can filter the search by type and locale. If no filters are applied, search includes all dictionaries.
3. Click the filter icon to add a new filter.
   - Click **Add Filter**.

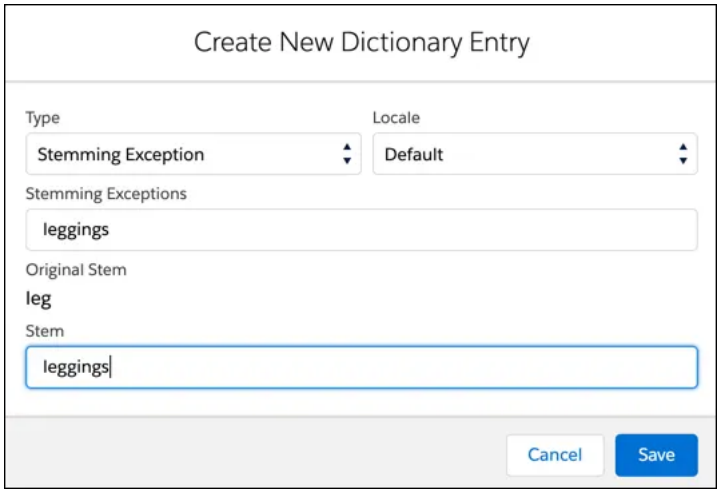
- Select a field and a value.
- Click **Apply**.

4. Click **Edit List Filters** to edit an existing filter.

Stemming Exceptions

Next, let's see how easy it is to create new stems using stemming exceptions.

1. Open Business Manager.
2. Select **site** > **Merchant Tools** > **Search** > **Search Dictionaries**.
3. Click **Stemming Exceptions**.
4. Click **New**.



5. Enter leggings as the exception and leggings as the stem.
6. Click **Save**.

To push these changes to the production instance, Brandon asks Linda to replicate from development to the staging instance for testing, and then from staging to production.

Next Steps

Brandon learned how Agentforce Commerce Einstein can make search smarter on his Agentforce Commerce for B2C storefront. He explored Search Dictionaries and learned how to configure and use Search Dictionaries to improve shopper search results. Next, he implements Agentforce Commerce Einstein Search Recommendations.

Quiz

+100 Points

To complete this unit, you need to answer all the quiz questions correctly.

1 What is one way Einstein Search Dictionaries adds value compared to standard keyword search?

A It provides basic search-as-you-type with advanced features.

B It automatically detects relationships between search terms and adds data to existing dictionaries.

C It allows merchants to manually create search dictionaries based on specific data.

D It only uses the site's data by default.

2 Which of the following is a standard search feature in Salesforce Agentforce Commerce for B2C?

A Predictive Sort

B Search Recommendations

C Keyword Search

D Einstein Search Dictionaries

Second attempt earns 50 points. Three or more earns 25 points.
